

1 Open the Changes list

In the sidebar, click **Changes**, then press the green **+ New Change** button (top right).

The Changes overview — start here with “+ New Change”.

2 Pick the right track

- Standard** — pre-approved, low-risk template; auto-approves and skips CAB.
- Normal** — full lifecycle with planning, approvals, CAB review, testing and PIR.
- Emergency** — expedited path with eCAB approvals; use only when it cannot wait.

3 Describe the change

Give it a clear **title** and **description** (what, why, and affected systems). Set **Impact** and **Probability of failure** — the **risk score** is calculated automatically from the decision matrix.

4 Plan and assign

Set the **planned start/end** window, choose a **category**, optionally link the originating ticket, pick the **requester** from the directory, and confirm the **change owner**. Enable **pre-production testing** if a test stage is needed before scheduling.

5 Create it

Click **Create change**. The request starts in **Draft** — you can refine it, then submit it for approval. Track progress anytime from the Changes list or the change’s detail page.

Tip: anyone can join the conversation — use the **Discussion** tab on the change to ask questions or add context, even if you’re not the owner or approver.

The “New change request” form — track selection, details, risk score, planning and ownership.

What happens next? Normal changes go through **approval → CAB review → implementation → post-implementation review (PIR)**. You’ll be notified at each step; approvers vote directly on the change.
